

Surface Ocean Current Speed – Western Australia & Southern Indian Ocean

Here's a more applied example of how you might use Curl in a Data Analysis setting.

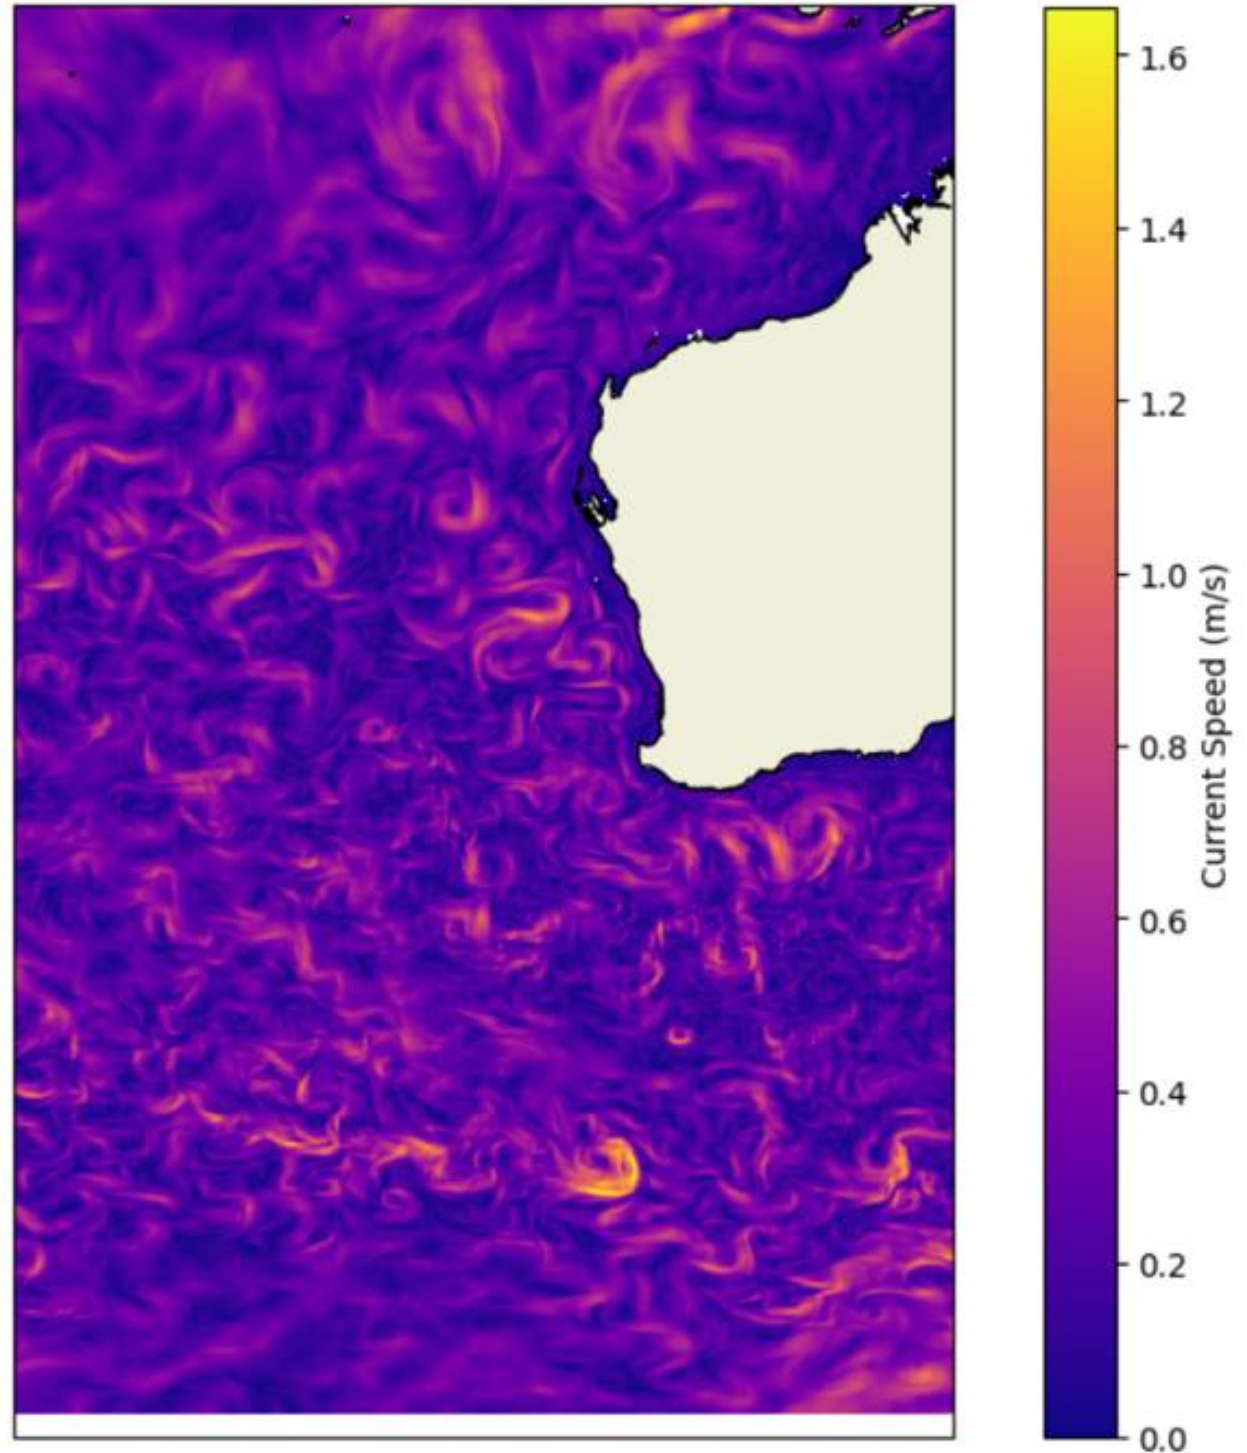

If you like, here's some questions to test your ability to understand the intuition of curl/divergence:

What do the red/blue regions mean for the divergence plot?

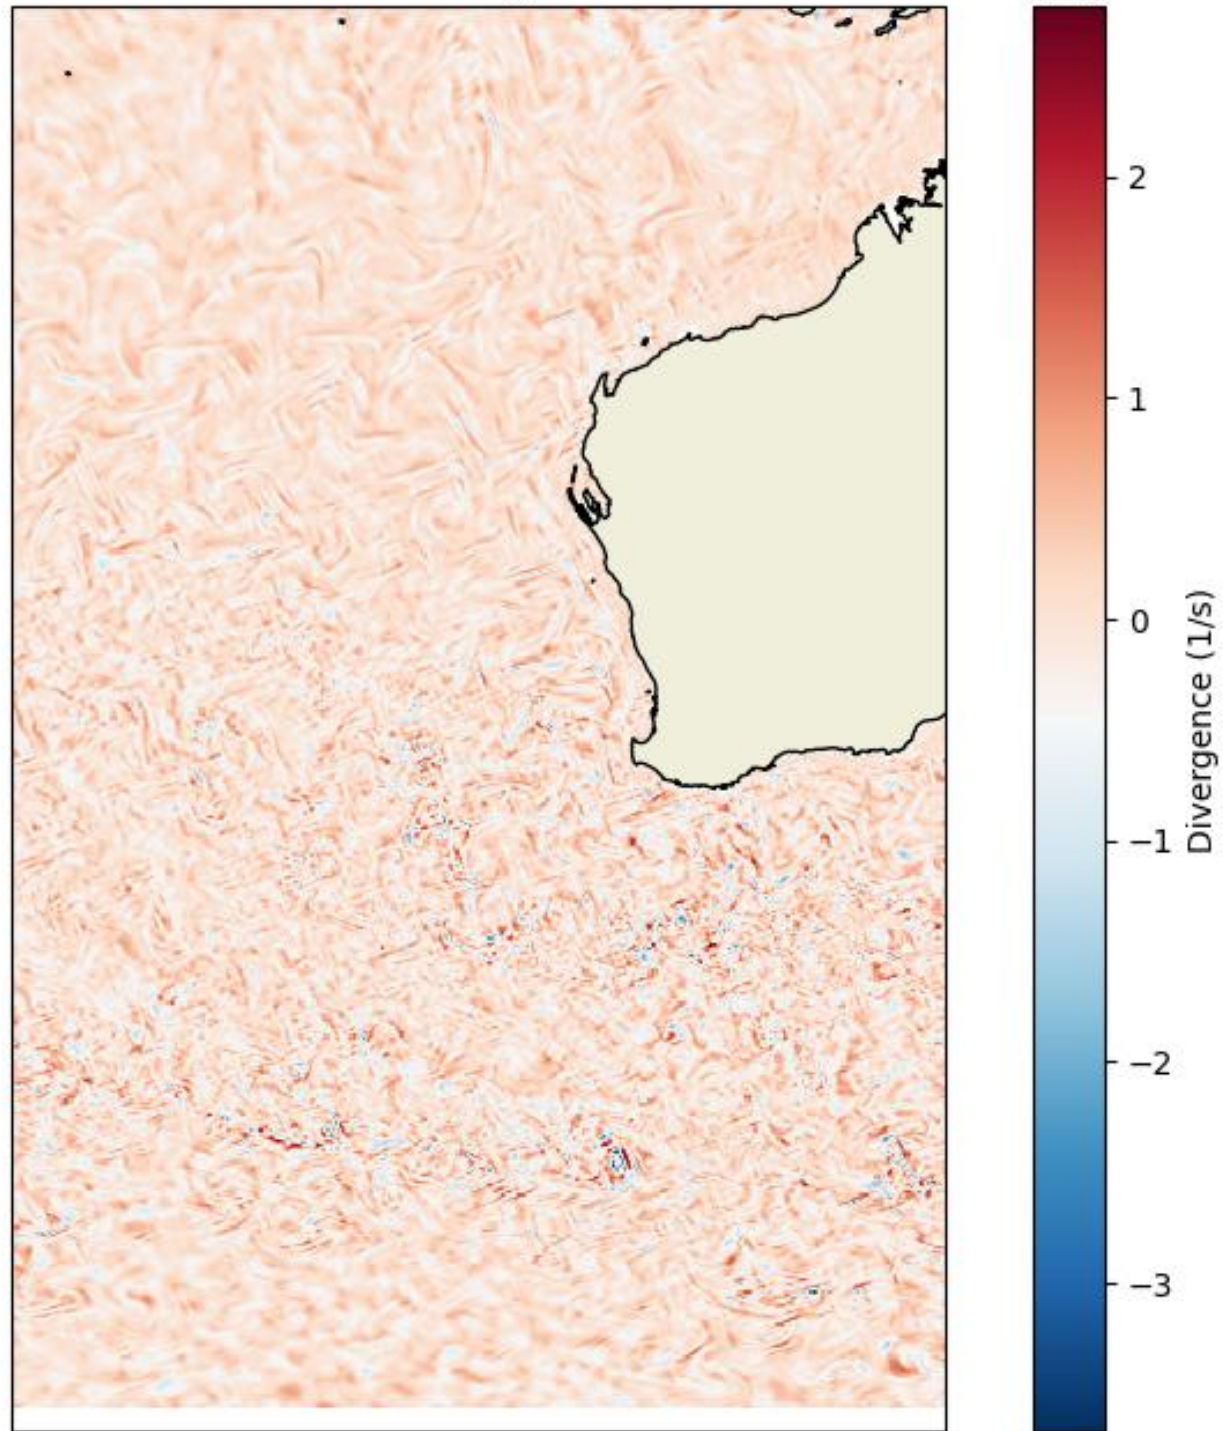

What do the red/blue mean in terms of clockwise/counter-clockwise rotation for the curl plot?

When information does the divergence/curl plot give us that the ocean current speed plot doesn't?

What are some of the modelling problems when using these curl and divergence plots to make inferences about ocean currents?

Surface Ocean Current Divergence - Western Australia $1e-5$

Surface Ocean Current Curl (Vorticity) - Western Australia 10^{-6}
